Are Government Owned Organizations Deliberately Demonized? The Organizational Citizenship Behavior Indicators

Jagannath Mohanty

Abstract
Traditionally in India the Government owned enterprises has been cursed by people and scholars equally. The notional drivers of change and progress, these giants have been criticized over the years as grossly inefficient, over staffed, bureaucratic and killingly slow in decision making. Though there is little empirical evidence over these claims. A very few studies have been made to establish the contributory factors to these claims. Organizational Culture is a huge contributor in making of an organization its people and its processes, yet very little study is available to refer on impact of Organizational Culture on discretionary behaviors of employees working in the Government owned organizations or PSUs. The current work would focus on bringing out the distinctive impact of Organizational Culture on Organizational Citizenship Behavior in the private and the public sector companies, thus attempting to gauge the degree of impact on both these sectors. The paper takes three different sectors to examine the discretionary behaviors in three divergent sectors namely; Government owned PSU, a modern private sector bank and a prominent IT organization.

JEL classification numbers: M1, M10, M14
Keywords: Organizational Culture, Organizational Citizenship Behavior, Public Sector Undertakings, Banking sector, IT sector and Manufacturing sector.

1 Introduction
The PSUs were created after independence with multiple objectives and not purely as profit-making organizations. They have undoubtedly contributed to the process of industrialization by providing a strong industrial base, generating large employment,
creating self-reliance in certain key sectors, and promoting professionalism in the management of enterprises. Their importance in the Indian economy can never be over emphasized. They account for over 22 % of the country’s GDP, around 6 % of the total employment in the organized sector and over 20 % of direct and indirect tax collections. A number of PSUs also serve critical functions of furthering the socio-economic objectives of the Government and ensuring stability in prices of key products and commodities. With the economy fully exposed to the process of Liberalization, Privatization and Globalization since the early-1990s, the role of the Indian Public Sector has subsequently undergone a rapid change (Deloitte & Touche Consulting, 2011).

Since inception, the Central Public Sector Enterprises (CPSEs) have been the mainstay of the Indian economy and were set up with the mandate to i) serve the broad macro-economic objectives of higher economic growth, ii) achieve self-sufficiency in production of goods/services, iii) facilitate long term equilibrium in balance of payments and iv) ensure stability in prices and create benchmarks for prices of essential items (Deloitte & Touche Consulting, 2011).

In the pre-independence era, the public sector enterprises were confined primarily to select sectors including Railways, Posts & Telegraphs, Port Trust, Ordnance Factories, etc. Today it encompasses almost every sector of economic activity. Thus, the number of CPSEs as on 31 March, 2009, was 246, with a total capital employed of nearly Rs. 5.3 lakh crores as against 5 CPSEs having a total investment of Rs. 29 crores on the eve of the first Five year plan. The turnover of CPSEs have increased from Rs. 7.4 lakh crores in FY 2005 to an estimated Rs.12.6 lakh crores in FY 2009 registering a CAGR of 14.1% during the FY 2005-09 period. Further, the growth in CPSEs has been in line with the overall GDP growth of the country, recording a CAGR of 14.5% during the same period. Consequently, in terms of turnover, the contribution of CPSEs to the GDP has ranged between 22%-23% during the period (Economic Survey, 2010).

Despite these impressive statistics, many believe these mammoth enterprises could have done far better than what the results show. Some also contend that if these were privatized before, their performance and profitability would have increased many folds. Some also allege the organizational culture responsible for poor results. Allegations include lack of commitment, lack of motivation, bureaucracy and red tapeism, redundant workforce, excess manpower and a severe top down approach among others. Many of the above mentioned factors are antecedents of OCBs particularly workplace commitment and motivation (Organ, 1988).

2 Literature Review

The construct of the public interest is central to traditional public administration scholarship (Appleby 1945; Herring 1936). In recent years, this theoretical development has been gradually joined by empirical work as scholars have sought to operationalize what public interest means for employees, why they develop a strong sense of public service, and how that sense influences their behavior (e.g., Alonso and Lewis 2001; Brewer and Selden 1998; Brewer, Selden, and Facer 2000; Crewson 1997, Houston 2000; Perry 1996, 1997). Although some of the empirical work offers evidence of no difference between public and private organizations on extrinsic and intrinsic motivators (Buchanan 1975; Gabris and Simo 1995), the bulk of the empirical evidence supports the existence of a public service ethic among public employees. Careful investigation of the public Service

Only rarely are public sector organizations driven by the profit motive. On the contrary, they are typically motivated by social and political goals, which are often numerous, varied, and difficult to quantify (Adams 1979; Bozeman 1987; Kobrak 1996; Larson and Coe 1999; Rainey 1983). These organizations are less exposed to the market and its rigorous application of cost-cutting measures or, more generally, to efficiency requirements. Instead, resources are allocated with political pressures and equal access to services is taken into consideration (Aharoni 1986; DeWitt et al. 1994; Libecap 1996). The financial resources are gathered through complex organizational, social, and political processes. As a result, these organizations receive funds indirectly from citizens, who lose sight of the link between paying for and receiving a service (Anderson 1970; Black 1982; Lynn 1981). These organizations often provide services with more far-reaching consequences than those involving direct contact with customers, and they are held accountable for the indirect consequences of their actions (Durant et al. 1986; Wilson and Rachal 1976). These organizations are subject to greater scrutiny by society, so all of their major decisions must be transparent. Their decisions may even require achieving a consensus among and consultation with the most important groups in civil society (Blumenthal 1983; Lau, Newman, and Broedling 1980; Moe 1994; Moe and Stanton 1989). Their risk-profit profiles are conducive to safe decisions and error avoidance (Bower 1983; Davies 1981; Hafsi 1989). In a large public sector organization, entrepreneurship is promoted or suppressed by the prevailing conditions within the organization, which, according to contingency theory, are themselves correlated with the nature of the organization's environment (Moon 1999; Morris and Jones 1999; Thompson 1967). Such organizations, operating within intense, aggressive environments, tend to generate standardized, rigid behavior, which, in turn, eliminates all entrepreneurship. Discouraging factors most often mentioned seem to be (1) rules, procedures, and policies and their fastidious application; (2) restrictions in the area of human resource management (recruitment, dismissal); (3) paltry rewards and internal rivalry; and (4) lack of managerial autonomy (Morris and Jones 1999). It is generally acknowledged that these characteristics of the public sector are mostly not amicable to risk taking and innovation (Lin 1992; Meyer and Lyons 2000; Moon 1999). As a result, the public sector has traditionally been thought to be incompatible with manifestations of entrepreneurship (Leadbeater 1998). In particular, (Moon 1999) has shown that the conditions leading to higher degrees of public sector entrepreneurship are not dissimilar from those observed in the private sector.

The study of organizational culture is not a recent phenomenon (Trice & Beyer, 1993). Organizational culture has long been regarded as a critical determinant of an organization's effectiveness (Deal & Kennedy, 1982; Peters & Waterman, 1982; Schein, 1992; Ouchi, 1983). Some exceptions have emerged, including influential work by Kotter and Heskett (1992), who found a correlation between indices of “strong” culture (e.g., clearly identifiable, consistent values) and long-term organizational performance. Researchers have argued that improving, maintaining or changing organization culture assists in making organizations more competitive and in helping revitalize declining organizations. Still, despite this potential importance, organizational culture is still a very controversial area of study among organizational researchers (Quinn & Spreitzer, 1991). Culture has been historically molded (Hofstede et al., 1990) and deeply ingrained in an organization and as a result is difficult to change (Atchison, 2002; Drucker, 1995;
Hofstede et al., 1990; Narine & Persaud, 2003; Taylor, 2003). Culture influences the communication skills and decision-making processes of the organization’s members and affects its credibility (Cooke & Rousseau, 1988; Kowalczyk & Pawlish, 2002; Mycek, 2000). Organizational culture also shapes the organization’s level of socialization and learning (Cooke & Rousseau, 1988). Kowalczyk & Pawlish (2002) correlated the importance of culture to an organization’s competitive advantage, adaptability, and level of innovation. It has been further noted that the culture of an organization may affect organizational system operations, productivity, leadership actions (Shaw, 2002; Taylor, 2003), performance (Cameron & Quinn, 1999), and organizational effectiveness (Parry, 2004; Valentino et al., 2004). Research has shown that culture has influenced employees’ commitment (Lok & Crawford, 1999; Mycek, 2000; O’Reilly, 1989; Parry, 2004; Putz, 1991; Webster, 2004) and behaviors (Atchison, 2002; Cooke & Rousseau, 1988). It has been further noted that the culture of an organization may affect organizational system operations, productivity, leadership actions (Shaw, 2002; Taylor, 2003), performance (Cameron & Quinn, 1999), and organizational effectiveness (Parry, 2004; Valentino et al., 2004). Research has indicated that culture has influenced employees’ commitment (Lok & Crawford, 1999; Mycek, 2000; O’Reilly, 1989; Parry, 2004; Putz, 1991; Webster, 2004) and behaviors (Atchison, 2002; Cooke & Rousseau, 1988). The change in organizations is pervasive due to the amount of change in the external environment (Cameron & Quinn, 1999). Culture emerges as people within organizations learn how to deal with these changes or uncertainties. It gives them accepted ways of expressing and affirming their beliefs, values and norms (Trice & Beyer, 1993). In short, “cultures are a natural outgrowth of the social interactions that make up what we call organizations” (Trice & Beyer, 1993.).

Organizations that employ individuals who exhibit Organizational Citizenship Behaviors are more likely to have effective work groups within the organization (Podsakoff, Ahearne, & Mackenzie, 1997). Empirical studies on Organizational Citizenship Behaviors have been conducted in various industries, including sales (Mackenzie, Podsakoff, and Fetter, 1993; Podsakoff & Mackenzie, 1994), education (Somech et. al, 2004), communications, (Podsakoff et.al 2000), and banking (Wheatley, 2002). Organizational Citizenship Behavior research has also expanded across the globe, with studies being conducted in organizations in countries other than the United States. Organizational Citizenship Behaviors have been studied in organizations in Canada (Latham & Skarlicki, 1996), Taiwan (Farh, et al. 1990), China (Farh, Zhong, & Organ, 2004), and Israel (Somech, et. al. 2004). (Chhokar, Zhuplev, Fok, and Hartman 2004) conducted a study on Organizational Citizenship Behavior that expanded across the boundaries of five different countries. They examined Organizational Citizenship Behavior in France, Britain, India, Russia, and the United States and found that in all there has been an impact of Organizational Citizenship Behavior.

Traditional task-based jobs, comprised of fixed packages of similar tasks, have been “unbundled” into “broader chunks of work that change over time’ (Cascio, 1995), resulting in more ambiguous work roles. To function effectively, it is not enough for an organization to “depend solely upon its blueprints of prescribed behavior” (Katz, 1964). Organizations have accordingly been relying increasingly on their employees’ willingness to contribute beyond formal job descriptions and on their leaders to inspire an empowered workforce. Organizational citizenship behavior, originally conceptualized as extra-role behavior were valued by the organization but not explicitly recognized by formal reward systems (Organ, 1988), and leader-member exchange (Graen & Scandura, 1987), have
much to offer for the effective functioning of these new forms of organizations. Considerable empirical evidence has converged on the finding that Organizational Citizenship Behaviors have a significant impact on managerial performance appraisals and other managerial decisions (Allen & Rush, 1998; Avila, Fern, & Mann, 1988; Borman, White, & Dorsey, 1995; Conway, 1999; Johnson, Erez, Kiker, & Motowidlo, 2002). In some cases, these findings indicate that citizenship behaviors have substantially greater influence on performance appraisals than objective performance information (Lowery & Krilowicz, 1994; MacKenzie et al., 1999). A smaller set of studies has investigated the influence of citizenship behaviors on other managerial decisions. (Orr et al. 1989) investigated the relative impact of contextual and task behaviors on supervisor ratings of the monetary value of employee contributions at work. Results indicated that contextual behaviors explained significant variance in Standard Deviation estimates, beyond what is explained by task behaviors alone. Additionally, (Kiker and Motowidlo 1999) found that both contextual and task performance significantly influenced supervisor reward allocation decisions. In a military sample, (Van Scotter, Motowidlo and Cross, 2000) demonstrated that contextual performance explained significant additional variance beyond task performance in rewards such as medals received, promotability ratings, and informal rewards.

3 The Conceptual Model

![Figure 1: The conceptual model](image-url)
4 The Organizational Culture Variables

4.1 Belief and Norms
Belief & Norms tend to reflect the values of the group and specify those actions that are proper and those that are inappropriate, as well as rewards for adherence and the punishment for non-conformity. Cultural norms are behavior patterns that are typical of specific groups. Such behaviors are learned from parents, teachers, peers, and many others whose values, attitudes, beliefs, and behaviors take place in the context of their own organizational culture.

4.2 Individual Responsibility
Individual responsibility is a social phenomenon that is explained as the accumulation of the unintended consequences of individual actions. The theory of individual responsibility implies a simple-minded view of causation, namely, that the only important type of action is the kind where one individual can single-handedly and, either deliberately or recklessly, bring about the consequence.

4.3 Structure
A structure is the distributions along various lines of people among social positions that influence the role relations among people. Structure is a pattern of decision-making and communication among a set of actors who perform tasks in order to achieve goals.

4.5 Individual Autonomy
Individual autonomy is defined as the extent to which organizations enable self-determination and discretion in job activities, freedom to control the pace of work, and to determine work processes and evaluation procedures.

4.6 Conflict Tolerance
Conflict Tolerance is the appreciation of diversity and the ability to live and let others live. It is the ability to exercise a fair and objective attitude towards those whose opinions, practices, religion, nationality and so on differ from one's own. Tolerance is not just agreeing with one another or remaining indifferent in the face of injustice, but rather showing respect for the essential humanity in every person.

4.7 Support
The activity of contributing to the fulfillment of a need or furtherance of an effort or purpose to furnish with strength or means for the successful performance of any action or the attainment of any object.

4.8 Risk Tolerance
Risk Tolerance may be defined as the amount of risk, on a broad level; an entity is willing
to accept in pursuit of value to attain an organizational objective. It may also be stated as the residual risk the individual is willing to accept after implementing risk-mitigation and monitoring processes.

5 The Organizational Citizenship Behavior variables

5.1 Altruism
Discretionary workplace behaviors on the part of the employees that have the effect of helping a specific other with an organizationally relevant problem.

5.2 Conscientiousness
Discretionary workplace behaviors on the part of the employees that go well beyond the minimum role requirements of the organization in the areas of attendance, obeying rules and regulations, taking breaks, and so forth.

5.3 Sportsmanship
Willingness of the employee to tolerate less than ideal circumstances without complaining - to “avoid complaining, petty grievances, railing against real or imagined slights, and making federal cases of small potatoes”.

5.4 Courtesy
Discretionary workplace behaviors on the part of an individual aimed at preventing work-related problems with others from occurring.

5.5 Civic Virtue
Behavior on the part of an individual that indicates that he/she responsibly.

6 The Hypothesis
H1 - The incidence of OCBs in private sector organizations will be significantly higher than the public sector enterprise.
H2 – Factors of OCBs in private sector will have greater impact on individuals than the public sector.

7 Sample and Methodology
In this study, a specially designed Questionnaire was adopted to measure the employee’s perception on different aspects of the study. The Questionnaire used in the study is designed taking into account different theories and models of Organizational Culture & Organizational Citizenship Behavior. The questionnaires were distributed to the 550
employees working in the Organizations under study. The total no of questionnaires received was 380 representing a rate of return of 69 percent.

**Sector Representatives:** Public Sector Undertaking (PSU) or Public Sector Organization comprises of traditional government/public owned Manufacturing Organization (hence, PSU, and Manufacturing Sector/Organization are interchangeably and synonymously used). Private Sector/Organization comprises of Banking Organization and IT Company (hence, banking and IT organizations are interchangeably and anonymously used).

### 8 Findings

#### Table 1: Correlation of OC & OCB across all sectors/Organizations

<table>

<td>Manufacturing Organization</td>
<td>202</td>
<td>.764**</td>
</tr>
</tbody>
</table>

The results derived indicated a positive correlation between Organizational Culture and Organizational Citizenship Behavior ($r = .722$, $p < .01$) across all the organizations (Manufacturing, IT, Banking). The results also demonstrated a significant level of correlation between Organizational Culture and Organizational Citizenship Behavior in the individual organizations as well. For the Banking Organization the correlation was significant ($r = .626$, $p < .01$), similarly for the IT organization the correlation was also significant ($r = .635$, $p < .01$), again for the manufacturing sector the correlation was found to be ($r = .764$, $p < .01$) higher than the average of all the sectors and highest among the three organizations under study (Table 1).

In this hypothesis it was assumed that each variable in Organizational Culture will
Are Government Owned Organizations Deliberately Demonized?

positively impact the Organizational Citizenship Behavior, and impact in the private sector of OC on OCB will be higher than in the manufacturing sector. For this purpose correlation was conducted to establish the impact of Organizational Culture on Organizational Citizenship Behavior. It was observed that across the organizations and also in individual organizations, the correlation was positive from high to moderate levels (refer Table 2). It was observed though that support and civic virtue most correlated. And individual autonomy and courtesy least correlated though significantly correlated among other variables.

Analysis was done on the Banking Organization to observe the extent of influence that variables of Organizational Culture have on the Organizational Citizenship Behavior variables (refer Table 3). It was revealed that individual autonomy was insignificantly correlated with all other variables. Baring which all other variables are significantly correlated which establishes the impact of OC on OCB, with belief and norms recording most significantly correlated with sportsmanship and conscientiousness.

An analysis was done on the IT Organization to observe the extent of influence that variables of Organizational Culture have on the Organizational Citizenship Behavior variables (refer Table 4). It was revealed that individual autonomy was insignificantly correlated with all other variables. Baring which all other variables are significantly correlated which establishes the impact of OC on OCB, with belief and norms recording most significantly correlated with sportsmanship and conscientiousness.

Analysis was done in the Manufacturing Organization to observe the extent of influence that variables of Organizational Culture have on the Organizational Citizenship Behavior variables. As evident from the analysis that in the manufacturing organization all the variables across OC & OCB being significantly correlated, importantly each variable in this sector was found more correlated than each variable in the Banking and the IT sector. It was observed that all the variables of Organizational Culture were positively correlated with all the variables of Organizational Citizenship Behavior (refer Table 5).

9 Discussions

The analysis found support for the argument that cultural context plays a significant role in forming workplace attitudes, Paine and Organ (2000). Also the study finds some consistency that the workplace environment influences employee attitudes toward the organization (Aiken et al., 2000) and culture formulates employee attitude and behavior (Cameron and Quinn, 1999). In all difference in factors of Organizational Culture and Organizational Citizenship Behavior was absolutely insignificant. This indicates despite
differences among variables in previous discussion, in most Organizations Culture has a long lasting impact. There is no hesitation in observing that every Organization value its culture and expect people to emerge as true citizens of the Organization. The results have indicated that all the factors are vital for functioning of the Organization.

The paper was aimed at evaluating the impact of Organizational Culture on Organizational Citizenship Behaviors of the employees working in three different sectors i.e. Banking, Information Technology and the Manufacturing. It is amply demonstrated that PSUs have credibility and strong cultural tenets. Also it became evident from the analysis that despite diversity in every aspect of the Organizational functioning, still factors displayed a congruent behavior across all sectors. PSUs which long have criticized for its lack of Organizational Culture and a sense of commitment got more or less negated through very insignificant differences in the variables across all sectors Organizations.
